

Cross Cloud Community Care Solution

Proposed design analytics and AI

Solution Objective

This artefact is created to help design, build, and deploy the following:

1. Foundational AHDS platform which is extensible to support bringing in MC4H data along with other structured and un-structured, clinical and non-clinical data in a single repository to deliver multiple use-cases for a unified patient view
2. An MVP base implementation template for outcomes like Demand/Capacity dashboard for Elective Surgery, to assist with planning purposes using Azure Health Data Services (AHDS)
3. An AI/ML ready platform, which can automate the planning and even out the load through predictive modelling
